

Project 0: Hello World

Due: Friday Jan 19, 11:59 pm

1 Assignment Overview

You are to ensure that you have Python setup on your system. All of the later projects this semester will require writing Python code. If you haven't done so already, download a copy of Python. Be sure to download Python 3 rather than the legacy Python 2. You may also want to install an IDE such as PyCharm.

Once you have Python setup, you will use it to execute the `hello.py` file. You will upload the generated file to D2L Dropbox.

2 Assignment Deliverables

The following files are expected to be turned in.

- `hello.txt`

Be sure to use the specified file name and to submit your files for grading via **D2L Dropbox** before the project deadline. **This project will be worth only 5 points instead of the usual 100.**

3 Assignment Notes

- Future projects will be tested in a Python 3 environment, so you will want to use Python 3 to work on your projects. Python 2.x is used for legacy systems.
- Python 3.6.4 is currently the latest version.
- Some distributions come with Python 2 installed. For example, Black has both Python 2.7 and 3.4 installed, but uses Python 2.7 by default. You will want to ensure that Python 3 is installed on such systems.
- On future projects, **points will be deducted if your solution has warnings of any type.**
